BP:

None of these patients had post op wound infection or fever and were discharged on expected postop days .In both operation theatrs no traditional fumigation was carried out,saving us from irritaion of eyes,throat and efforts to avoid personel errors in doing that Arocide works noiselessly and continuously making the surgeon relxed about worries regarding intra and post op infections.

I would like to mention the following points regarding advantages of arocide

1) Traditional methods of fumigation are required to be done round the clock and

one staff member is engaged with it

2) Human errors in maintaining the protocol of fumigation are avoided

3) Minimal and appropriate use of antibiotics resulting in reducion of cost of surgery.

4) Early discharge to patient thereby avoiding patients longer stay in hospital for wound infecion.

In future we are planning to install Arocide units in ICU and CONSULTING ROOMS.

Thanks for introducing this technology through Mr Omkar Banwaskar which is helping us to get rid of nosocomial and post op infections.
